

Exam 1 Prep

What are the 3 types of *polymorphism* in C++?

- Operating Overloading
- Name Overloading
- Virtual Methods

What is an example of *name overloading* in C++?

- Class(int x)
- Class(int x, int y)

What is an example of *operator overloading* in C++ syntax?

- int a = 1 + 3;
- double b = 1.5 + 2.5;

How do you implement a *Pure Virtual Method* in C++?

- virtual void square() = 0;

T/F: A *Pure Abstract Class* contains *Pure Virtual Methods*.

- True

What is the creation and destruction of *inherited class* Instances?

- BD->DB

How would you place an object on the *Heap*?

- Class * varName = new Student();

What are the 6 different components to a **makefile*?

- Comment
- Rules
- Shell line
- Dependency line
- Inference line
- Macro

What are the 3 types of *inheritance* found in C++?

- Public
- Private
- Protected

What is the *default visibility* of variables in C++?

- Protected

T/F: Constructors can and should declared virtually is you have dynamically allocated memory.

- False

T/F: *Virtual function methods* support static polymorphism in C++.

- False (Dynamic)

What is a abstract data type?

- Collection of Data, Attributes
- Set of Operations, Methods

What are the type of *abstraction* in all OO Programming Language?

- Data
- Function

What are the 4 phases of an *abstract data types* life?

- Construction
- Initialization
- Usage
- Deconstruction

T/F: *Life time* is a temporal concept.

- True

T/F: If something is *imputable*, that means it can change.

- False

In C++ what symbol is the *XOR*?

- ^
